

INTERNSHIELD CLOUD SECURITY COMMAND CENTER (IS-CSCC)

"Cloud Security. Intelligence. Visibility."

Designed & Developed by **Vidit Shringi** | InternShield

Version: 1.0

Project Overview

The InternShield Cloud Security Command Center is a production-quality, interactive terminal-based DevSecOps platform. It provides a unified interface for authorized security assessments across AWS infrastructure and Docker environments, augmented by interchangeable AI providers (Shell-GPT, OpenAI, Anthropic, Gemini, Local LLMs).

Default Posture: READ-ONLY. This tool is built on the principles of least privilege and strict human oversight. It does not perform destructive actions, automatic remediations, or unauthorized scanning.

High-Level Architecture

Installation & Setup

1. Clone & Setup Environment

```
git clone [https://github.com/yourusername/internshield-cloud-security.git](ht
cd internshield-cloud-security
python3 -m venv .venv
source .venv/bin/activate
pip install -r requirements.txt
```

2. Configuration Copy the example configurations to secure local files:

```
cp config.example.yaml config.yaml
cp .env.example .env
```

Note: Never commit .env or config.yaml to version control if they contain active credentials.

3. Verify System Health

```
python main.py health
```

Security & Responsible Use Policy

This tool is strictly designed for **authorized security assessments, DevSecOps pipelines, and educational lab environments.**

- **No arbitrary command execution:** All AI-generated remediations are presented as text for human review.
- **Credential Safety:** The application uses structured logging and sanitizes outputs to prevent secret leakage in reports.
- **AWS Permissions:** Only explicit `ReadOnlyAccess` or granular `SecurityAudit` IAM policies should be attached to the user running this tool.

Your Shield in the Digital World.
